                            2*dnorm(0)*(sigma^2 - 1)/sqrt(sigma^2 + 1 - 2*rho*sigma),
                            2*dnorm(0)*(sigma^2 - 1)/sqrt(sigma^2 + 1 - 2*rho*sigma))
  ) %>%
    mutate(estimate = round(estimate, 2),
           `theoretical result` = round(`theoretical result`, 2))
}
```

```
kable(results)  
}
```

Simulation results

```
roy_model(2, 0.5)
```

quantity of interest	estimate	theoretical result
ATE	0.02	0.00
ATT	1.36	1.38
ATUT	-1.40	-1.38
Beta_OLS	1.36	1.38
$E[Y D = 1] - E[Y D = 0]$	1.36	1.38

The simulation shows that

$$E[Y|D = 1] - E[Y|D = 0] = \beta_{OLS}$$

```
roy_model(2, 0)
```

quantity of interest	estimate	theoretical result
ATE	0.02	0.00
ATT	1.75	1.78
ATUT	-1.81	-1.78
Beta_OLS	1.03	1.07
$E[Y D = 1] - E[Y D = 0]$	1.03	1.07

```
roy_model(2, -0.5)
```

quantity of interest	estimate	theoretical result
ATE	0.02	0.00
ATT	2.07	2.11
ATUT	-2.14	-2.11
Beta_OLS	0.86	0.90
$E[Y D = 1] - E[Y D = 0]$	0.86	0.90

Fixing $\rho = 0.5$ and varying σ

```
roy_model(1, 0.5)
```

quantity of interest	estimate	theoretical result
ATE	0.01	0.0
ATT	0.79	0.8
ATUT	-0.80	-0.8
Beta_OLS	-0.01	0.0
$E[Y D = 1] - E[Y D = 0]$	-0.01	0.0

```
roy_model(2, 0.5)
```

quantity of interest	estimate	theoretical result
ATE	0.02	0.00
ATT	1.36	1.38
ATUT	-1.40	-1.38
Beta_OLS	1.36	1.38
$E[Y D = 1] - E[Y D = 0]$	1.36	1.38

```
roy_model(4, 0.5)
```

quantity of interest	estimate	theoretical result
ATE	0.05	0.00
ATT	2.84	2.88
ATUT	-2.89	-2.88
Beta_OLS	3.26	3.32
$E[Y D = 1] - E[Y D = 0]$	3.26	3.32

```
roy_model(10, 0.5)
```

quantity of interest	estimate	theoretical result
ATE	0.13	0.00
ATT	7.53	7.61
ATUT	-7.61	-7.61
Beta_OLS	8.18	8.28
$E[Y D = 1] - E[Y D = 0]$	8.18	8.28
